## MATH 158 MIDTERM EXAM 1 5 OCTOBER 2016

Name :
--------

- The exam is double-sided. Make sure to read both sides of each page.
- The time limit is 50 minutes.
- No calculators are permitted.
- You are permitted one page of notes, front and back.
- The textbook's summary tables for the systems we have studied are provided on the last sheet. You may detach this sheet for easier reference.
- For any problem asking you to write a program, you may write in a language of your choice or in pseudocode, as long as your answer is sufficiently specific to tell the runtime of the program.

 $This \ page \ intentionally \ left \ blank.$ 

- (1) Alice and Bob are using Elgamal encryption, with public parameters p = 29, g = 19. The summary table for Elgamal is on the back page of this packet. There is also a multiplication table for  $\mathbb{Z}/29$ , so that you do not need to do the arithmetic by hand.
  - (a) Alice chooses the private key a=9. What is her public key? Express your answer as an integer in  $\{0,1,2,\cdots,28\}$ .

(b) Bob sends ciphertext (8,25) to Alice. What is the plaintext? Express your answer as an integer in  $\{0, 1, 2, \dots, 28\}$ .

(2)	(a)	Suppose that $a \mid m$ . Prove that the congruence $ax \equiv ab \pmod{m}$ only if the congruence $x \equiv b \pmod{\frac{m}{a}}$ holds (all variables are integer	nolds if and rs).
		Part (b) on reverse side.	(3 points)

(b) Suppose that $gcd(a, m) = 1$ . Prove that the congruence $ax \equiv ab \pmod{m}$ if and only if the congruence $x \equiv b \pmod{m}$ holds.	holds

(3) Write a program that reduces breaking Diffie-Hellman key exchange to breaking Elgamal encryption.

More precisely: suppose that Eve has written a function  $break_elg(p,g,A,c1,c2)$  with the following behavior: if the arguments are as in Table 2.3 (back of the packet), then this function will return m. Make use of this function to write a function  $break_dh(p,g,A,B)$ , which accepts arguments as labeled in Table 2.2 and returns the corresponding shared secret.

You may use any functions that are built into Python (or any language you have written your homework in), plus the hypothetical function  $break_elg$ . You may also assume that you have already written a function  $ext_euclid(a,b)$ , with the following behavior: given two positive integers a, b, this function returns a list of three integers [u, v, d], where  $d = \gcd(a, b)$  and au + bv = d.

For full points, your program must require at most  $\mathcal{O}(\log p)$  arithmetic operations (not counting any operations needed to compute break\_elg).

 $Additional\ space\ for\ problem\ 3.$ 

- (4) Let p be a prime number, and  $[g]_p$  an element of  $(\mathbf{Z}/p)^*$ .
  - (a) Prove that if  $\operatorname{ord}[g]_p = 17$ , then  $p \equiv 1 \pmod{17}$ .

(b)	Prove conve	ersely that if $\eta$	$p \equiv 1 \pmod{p}$	17), then the	ere exists some	element $[g]_p$ of

(5) Suppose that Alice and Bob use the following variant of Elgamal. The parameters p, g are as in table 2.3, and Alice chooses a secret key a and public key A in the same manner as in table 2.3. However, instead of following table 2.3, Bob computes his ciphertext as followings: he chooses a random element k, and computes

$$c_1 \equiv A^k \pmod{p}$$

$$c_2 \equiv m \cdot g^k \pmod{p},$$

then sends  $(c_1, c_2)$  to Alice.

Explain how Alice can efficiently decipher messages, i.e. determine m from  $(c_1, c_2)$ . You will need to place a restriction on Alice's original choice of private key a in order for decryption to be possible; clearly state this restriction.

 $Additional\ space\ for\ problem\ 5.$ 

 $Additional\ space\ for\ work.$ 

 $Additional\ space\ for\ work.$ 

Reference information. You may detach this sheet for easier use.

Public parameter creation											
A trusted party chooses and publishes a (large) prime $p$											
and an integer $g$ having large prime order in $\mathbb{F}_p^*$ .											
Private computations											
Alice	Bob										
Choose a secret integer a.	Choose a secret integer $b$ .										
Compute $A \equiv g^a \pmod{p}$ .	Compute $B \equiv g^b \pmod{p}$ .										
Public excha	nge of values										
Alice sends A to Bob —	$\longrightarrow$ A										
B ←	— Bob sends $B$ to Alice										
Further private	e computations										
Alice	Bob										
Compute the number $B^a \pmod{p}$ .	Compute the number $A^b \pmod{p}$ .										
The shared secret value is $B^a \equiv$	$(g^b)^a \equiv g^{ab} \equiv (g^a)^b \equiv A^b \pmod{p}.$										

Table 2.2: Diffie–Hellman key exchange

Compute $A = g^a \pmod{p}$ . Publish the public key $A$ .  Encryption											
A trusted party chooses and publishes a large prime $p$											
and an element $g$ modulo $p$ of large (prime) order.											
Alice	Bob										
Key creation											
Choose private key $1 \le a \le p-1$ .											
Compute $A = g^a \pmod{p}$ .											
Publish the public key $A$ .											
Encryption											
	Choose plaintext $m$ .										
	Choose random element $k$ .										
	Use Alice's public key A										
	to compute $c_1 = g^k \pmod{p}$										
	and $c_2 = mA^k \pmod{p}$ .										
	Send ciphertext $(c_1, c_2)$ to Alice.										
Decry	ption										
Compute $(c_1^a)^{-1} \cdot c_2 \pmod{p}$ .											
This quantity is equal to $m$ .											

Table 2.3: Elgamal key creation, encryption, and decryption
