(Supplement 1)

a) 
$$T = \begin{pmatrix} 0.6 & 0.3 & 0.4 \\ 0.1 & 0.4 & 0.3 \\ 0.3 & 0.3 & 0.3 \end{pmatrix}$$

$$dx(T-\lambda I) = \begin{vmatrix} 0.6-\lambda & 0.3 & 0.4 \\ 0.1 & 0.4-\lambda & 0.3 \\ 0.3 & 0.3 & 0.3-\lambda \end{vmatrix}$$

$$= (0.6-\lambda)(0.4-\lambda)(0.3-\lambda) + 0.3 \cdot 0.3 \cdot 0.3 + 6.4 \cdot 0.1 \cdot 0.3$$

$$- (0.6-\lambda) \cdot 0.3 \cdot 0.3 - 0.3 \cdot 0.1 \cdot (0.3-\lambda) - 0.4 \cdot (0.4-\lambda) \cdot 0.3$$

$$= 0.072 - 0.54\lambda + (.3\lambda^2 - \lambda^3)$$

$$+ 0.027 + 0.012$$

$$- 0.054 + 0.09\lambda$$

$$- 0.009 + 0.03\lambda$$

$$- 0.048 + 0.12\lambda$$

$$= -\lambda^3 + (.3\lambda^2 - 0.3\lambda)$$

$$= -\lambda(\lambda - 0.3)(\lambda - 1)$$

So the eigenvalues of T are 1.03,0. To find the eigenspaces:

$$\lambda_{1} = 1 \qquad V_{1} = N\begin{pmatrix} -0.4 & 0.3 & 0.4 \\ 0.1 & -0.6 & 0.3 \\ 0.3 & 0.3 & -0.7 \end{pmatrix} \quad (\text{now-neduction})$$

$$= N\begin{pmatrix} 0 & 1 & -10/21 \\ 0 & 0 & -10/21 \end{pmatrix} \quad (\text{now-neduction})$$

$$= \text{span} \left( \begin{bmatrix} \frac{33}{16} \\ 16 \\ 21 \end{bmatrix} \right) \; ; \quad \text{let} \quad \overrightarrow{V}_{1} = \begin{pmatrix} \frac{33}{16} \\ 16 \\ 21 \end{pmatrix} .$$

$$\lambda_{2} = 0.3 \qquad V_{0.3} = N\begin{pmatrix} 0.3 & 0.3 & 0.4 \\ 0.1 & 0.1 & 0.3 \\ 0.3 & 0.3 & 0 \end{pmatrix}$$

$$= N\begin{pmatrix} 0 & 0 & 0.3 & 0.4 \\ 0 & 0 & 0.3 \\ 0.3 & 0.3 & 0.3 \end{pmatrix}$$

$$= N\begin{pmatrix} 0.6 & 0.3 & 0.4 \\ 0.1 & 0.4 & 0.3 \\ 0.3 & 0.3 & 0.3 \end{pmatrix}$$

$$= N\begin{pmatrix} 0 & 0 & 0.3 & 0.4 \\ 0.1 & 0.4 & 0.3 \\ 0.3 & 0.3 & 0.3 \end{pmatrix} : \quad \text{let} \quad \overrightarrow{V}_{3} = \begin{pmatrix} -1 \\ -2 \\ 3 \end{pmatrix}.$$

So one possible eigenbasis is  $B = \left\{ \begin{pmatrix} 33 \\ 16 \\ 21 \end{pmatrix}, \begin{pmatrix} -1 \\ 1 \end{pmatrix}, \begin{pmatrix} -2 \\ 3 \end{pmatrix} \right\}$ the change of basis matrix P is

$$P = [T]_{4B}^{S} = \begin{pmatrix} 3 & 3 & -1 & -1 \\ 16 & 1 & -2 \\ 21 & 0 & 3 \end{pmatrix},$$

which has inverse

$$P^{-1} = \frac{1}{210} \cdot \begin{pmatrix} 3 & 3 & 3 \\ -90 & 120 & 50 \\ -21 & -21 & 40 \end{pmatrix}$$
, (computations omitted)

and the diagonal m form of T is

$$\mathcal{D} = \begin{pmatrix} \lambda_1 & 0 & 0 \\ 0 & \lambda_1 & 0 \\ 0 & 0 & \lambda_3 \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 0.3 & 0 \\ 0 & 0 & 0 \end{pmatrix}. \quad \left( \underbrace{A = PDP^{-1}} \right).$$

Hence the explicit form for  $T^n$  is  $\rho. D^n. P^{-1}$  i.e. b)

$$T^{n} = \begin{pmatrix} 33 & -1 & -1 \\ 16 & 1 & -2 \\ 21 & 0 & 3 \end{pmatrix} \begin{pmatrix} 1^{n} & 0 & 0 \\ 0 & (0.3)^{n} & 0 \\ 0 & 0 & 0 \end{pmatrix} \cdot \frac{1}{210} \cdot \begin{pmatrix} 3 & 3 & 3 \\ -90 & 120 & 50 \\ -21 & -21 & 49 \end{pmatrix}$$

$$= \frac{1}{210} \cdot \begin{pmatrix} 33 & -(0.3)^{9} & 0 \\ 16 & (0.3)^{9} & 0 \\ 21 & 0 & 0 \end{pmatrix} \begin{pmatrix} 3 & 3 & 3 \\ -90 & 120 & 50 \\ -21 & -21 & 49 \end{pmatrix}$$

$$= \frac{1}{210} \cdot \begin{pmatrix} 33 & -(0.3)^{n} & 0 \\ 16 & (0.3)^{n} & 0 \\ 21 & 0 & 0 \end{pmatrix} \begin{pmatrix} 3 & 3 & 3 \\ -90 & 120 & 50 \\ -21 & -21 & 49 \end{pmatrix}$$

$$= \frac{1}{210} \cdot \begin{pmatrix} 99 + 90(0.3)^{n} & 99 - 120 \cdot (0.3)^{n} & 99 - 50(0.3)^{n} \\ 48 - 90 \cdot (0.3)^{n} & 48 + 120 \cdot (0.3)^{n} & 48 + 50 \cdot (0.3)^{n} \end{pmatrix}$$

$$= \frac{1}{210} \cdot \begin{pmatrix} 99 + 90(0.3)^{n} & 99 - 120 \cdot (0.3)^{n} & 99 - 50(0.3)^{n} \\ 48 - 90 \cdot (0.3)^{n} & 48 + 120 \cdot (0.3)^{n} & 99 - 50(0.3)^{n} \end{pmatrix}$$

Hence we may check the answer to part (b) of 5.4.4 as follows:

problem after 5 fares: 
$$T^{5} \cdot \begin{pmatrix} 0.3 \\ 0.35 \\ 0.35 \end{pmatrix}$$

$$= \frac{1}{210} \begin{pmatrix} 99 + 90(0.3)^{5} & 99 - 120(0.3)^{5} & 99 - 50 \cdot (0.3)^{5} \\ 418 - 90(0.3)^{5} & 418 + 120 \cdot (0.3)^{5} & 418 + 50(0.3)^{5} \\ 63 & 63 & 63 \end{pmatrix} \begin{pmatrix} 0.35 \\ 63 & 63 \end{pmatrix}$$

$$= \frac{1}{210} \begin{pmatrix} 99 - 32.5 \cdot (0.3)^{5} \\ 48 + 32.5 \cdot (0.3)^{5} \\ 63 & 63 \end{pmatrix}$$

$$= \frac{1}{210} \begin{pmatrix} 98.921 \\ 48.079 \\ 63 \end{pmatrix}$$

 $= \begin{pmatrix} 0.471053. \\ 0.228948. \\$ 

Hence

$$\lim_{N\to\infty} T^{N} = \frac{1}{210} \begin{pmatrix} 99 & 99 & 99 \\ 48 & 48 & 48 \\ 63 & 63 & 63 \end{pmatrix}$$

$$= \begin{pmatrix} 33/70 & 33/70 & 33/70 \\ 16/70 & 16/70 & 16/70 \\ 21/70 & $21/70 & $21/70 \end{pmatrix}.$$

(3)

$$\begin{pmatrix} G_{n+1} \\ G_{n} \end{pmatrix} = \begin{pmatrix} 1 & 2 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} G_{n} \\ G_{n-1} \end{pmatrix} \qquad \text{(since } G_{n+1} = G_{n} + 2G_{n-1} \text{)}$$

$$\Rightarrow \begin{pmatrix} G_{n+1} \\ G_{n} \end{pmatrix} = \begin{pmatrix} 1 & 2 \\ 1 & 0 \end{pmatrix}^{n} \begin{pmatrix} G_{1} \\ G_{0} \end{pmatrix}$$

$$= \begin{pmatrix} 1 & 2 \\ 1 & 0 \end{pmatrix}^{n} \begin{pmatrix} 1 \\ 0 \end{pmatrix}.$$

so Gn is the lower-left entry of (12).

To diagonalize (10):

$$0 = \begin{vmatrix} 1-\lambda & 2 \\ 1 & -\lambda \end{vmatrix} = (1-\lambda)(-\lambda) - 2 = \lambda^2 - \lambda - 2$$
$$= (\lambda - 2)(\lambda + 1)$$

so 
$$\lambda_1 = 2$$
,  $\lambda_2 = -1$ .

For 
$$\lambda_1 = 2$$
:

Null space  $\begin{pmatrix} -1 & 2 \\ -1 & -2 \end{pmatrix} = span \begin{pmatrix} 2 \\ 1 \end{pmatrix}$ 

so let  $\vec{\nabla}_1 = \begin{pmatrix} 2 \\ 1 \end{pmatrix}$ .

For 
$$\lambda_2 = -1$$
, null space  $\begin{pmatrix} 7 & 7 \\ 7 & 7 \end{pmatrix} = span \begin{pmatrix} -1 \\ 7 & 7 \end{pmatrix}$ .

Hence 
$$\binom{1}{1}\binom{2}{0} = PDP^{-1}$$
 where  $P = \binom{2}{1}\binom{-1}{1}$ 

$$D = \binom{2}{0}\binom{-1}{1}$$

$$P^{-1} = \frac{1}{3}\binom{1}{-1}\binom{1}{2}$$

Hence

Since Gn is the lower-deft entry, we obtain

$$G_n = \frac{1}{3} (2^n - (-1)^n).$$
